Mabyo

A guide for mabar hosts, in running order

Everything on these pages is a real screen from the app. Pages 7 to 9 cover the parts that changed most recently — what happens when a match ends, the waiting list, and marking somebody away.

WHAT IS IN HERE

2 **Skill order is everything** Players

3 **Before you start** Game

4 **How the night runs** Settings · 1 of 2

5 **How players are matched** Settings · 2 of 2

6 **Running the session** Game

7 **When a match ends** Game · new

8 **The waiting list** Game · new

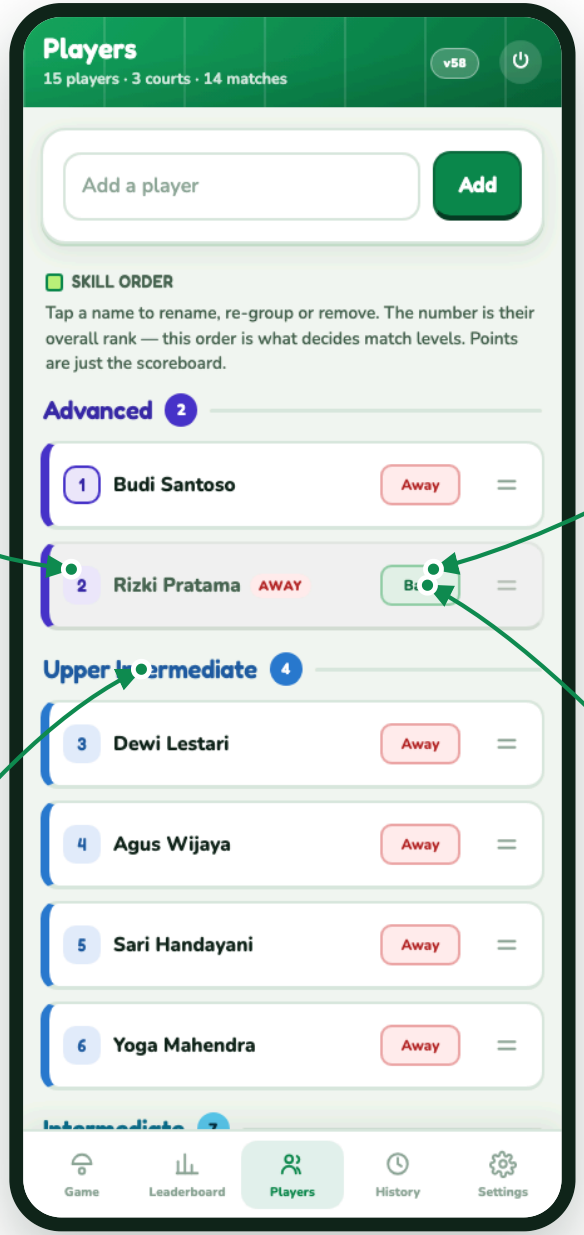

9 **Away, and back again** Players · new

10 **Who is actually winning** Leaderboard

11 **Fix mistakes now, not later** History

Skill order is everything

PLAYERS

The number is the ranking

Not a score and not a shirt number — position 1 is the strongest player in the hall. Everything the app does with skill reads this order.

Drag across a heading

Dragging a player past a group heading changes their group. That is how you promote or demote somebody mid-session.

Away without leaving this list

Every row has its own Away button. Tap it the moment somebody says they are sitting out — you do not need to find them on the Game screen.

Back when they return

An away player shows a red **away** tag and a **Back** button. Nothing about their record changes while they are out.

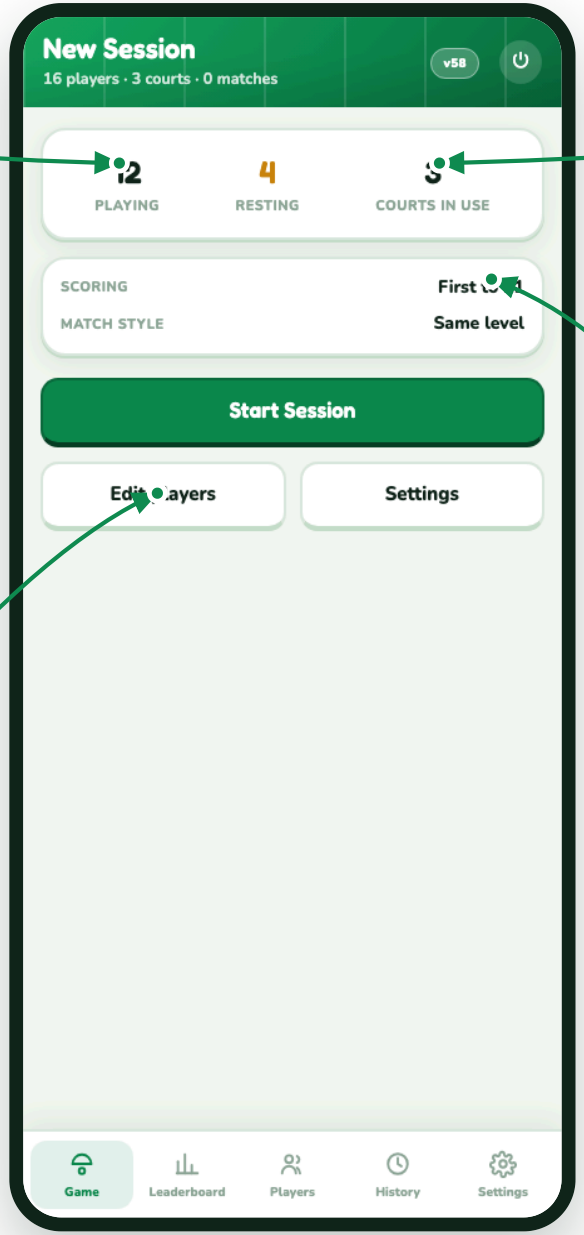

This list is the single most important thing in the app. Matchmaking reads it every time it draws a court, so a name in the wrong place produces lopsided games all night.

The split is automatic

Playing and Resting are worked out from how many people and how many courts you have. You never set them by hand.

Two very different buttons

Edit players is the roster. **Settings** is the rules of the night. Get both right before you start.

Courts is a maximum

If there are not enough players for every court, the app simply uses fewer. Setting four courts does not force four courts.

A read-out, not a control

These two lines show what Settings is currently set to. Tap **Settings** below to change them.

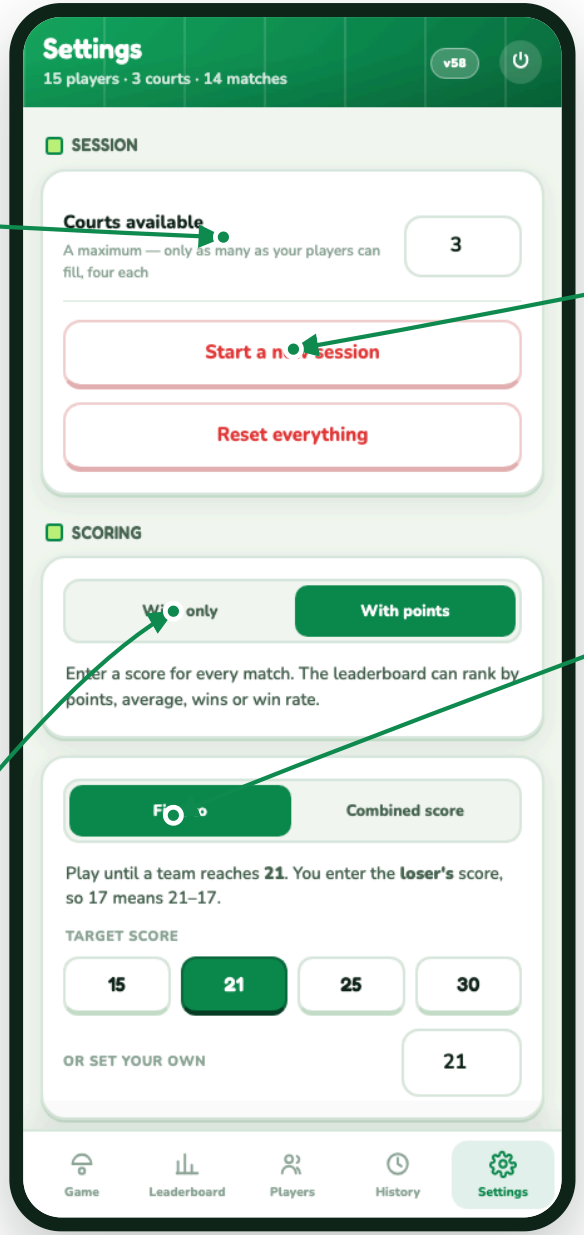

Add everyone first, put them in the right skill order, then press **Start Session**. You can still add, remove and reorder people after the night has begun.

A ceiling, not a target

Courts available is the most you will use. With fifteen players and four courts the app runs three, because a fourth would leave nobody waiting.

Skip the scores entirely

Wins only means you tap the winning team and nothing else. Much faster on a busy night, and the leaderboard still works.

One of these erases everybody

Start a new session keeps your players and clears the results. **Reset everything** deletes the roster too. They sit next to each other — read before you tap.

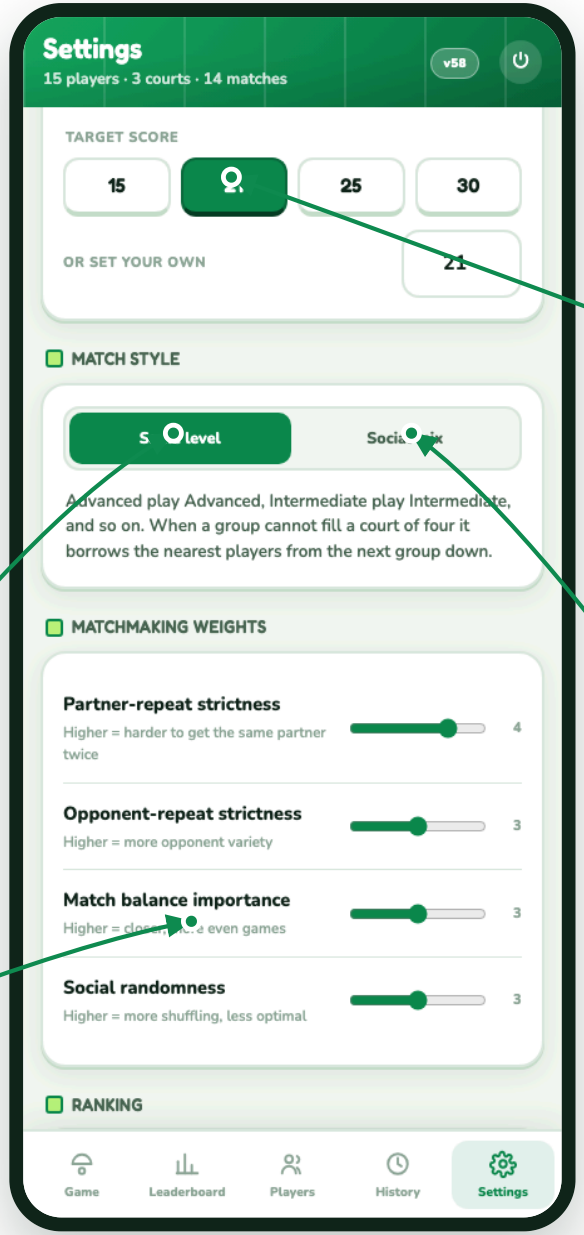

Two ways to count a game

First to 21 — you enter the **loser's** score, because the winner always has 21. **Combined 21** — both scores add up to 21 and you enter the **winner's**. Pick whichever your group already calls out across the net.

Courts and scoring shape the whole evening. The rest of Settings only fine-tunes how players are paired.

How players are matched

SETTINGS · 2 OF 2

The target score

What a team has to reach to win. **Or set your own** below accepts anything, for a quick first-to-11 session.

Who plays whom

Same level keeps each court within one skill group as far as it can. Use it when the gap between your best and worst player is wide.

… or mix everybody

Social mix ignores skill and spreads people around. Better for a casual night where nobody minds a mismatch.

These pull against each other

Variety and balance want different things. Turning everything to maximum does not give you a better night — it just makes the app pick between them more often.

If a night feels stale, raise partner and opponent strictness. If it feels lopsided, raise match balance. Changes take effect on the next court that is drawn.

… including someone waiting

With a player picked up, tap anyone in the queue and they walk straight onto the court instead.

One card per court

Courts are independent. Finishing court 1 does not touch courts 2 and 3.

Swap any two players

Tap one player, then tap another — they trade places. The app never tells you this is possible. Use it when a pairing looks wrong.

Read the colour, not the number

Green is a close match, amber is playable, red is one-sided. Use ↻ **Redraw** at the foot of the card if you do not like it.

During a match you tap **Finish match**, then the winning team and the score. The court does **not** refill itself — you decide when, on the next page. The other courts carry on undisturbed.

When a match ends

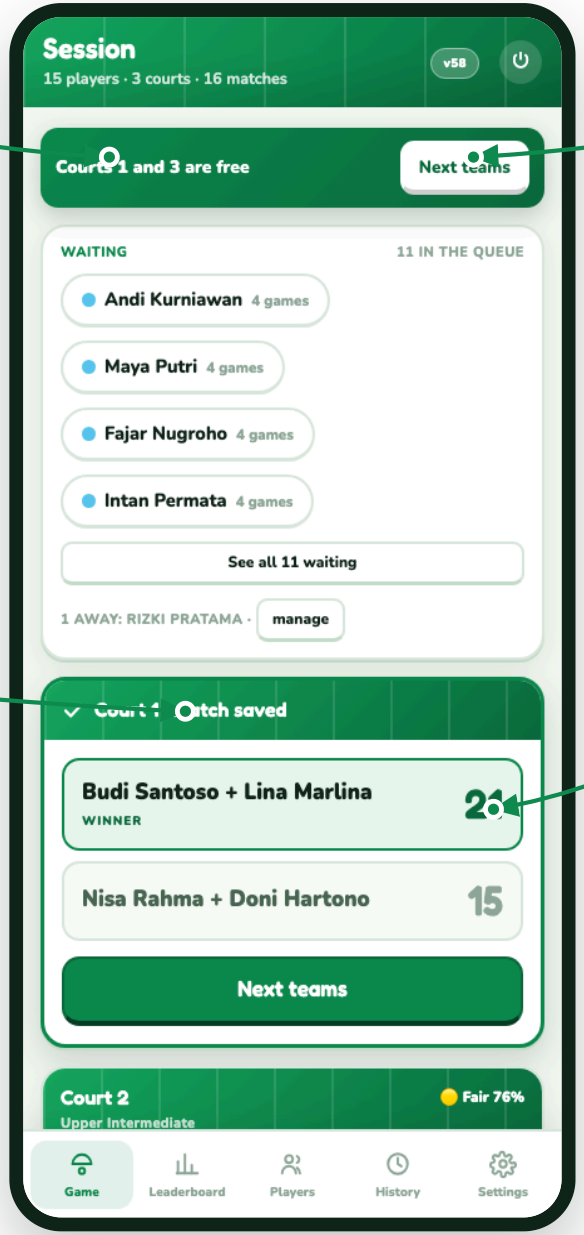

GAME · NEW

Two free courts are drawn together

When more than one court is free the app picks all eight players in a single decision, instead of filling one court and giving the second whoever is left. That mixes the groups far better.

One button, one decision

The panel shows who won and one thing to do next. To change a score or remove a match, use **History**.

Draw without going to find it

The green bar is the important one. It names every court standing free and draws them all from here, so you never scroll down the page hunting for a court that has finished.

Already saved

The result went into the leaderboard the moment you tapped Save result. Nothing on this screen is holding it up.

Saving a result no longer picks the next four — you do. That pause is what lets you wait a moment when another court is about to come off. With a single court there is nothing to wait for, so it draws straight away.

The waiting list

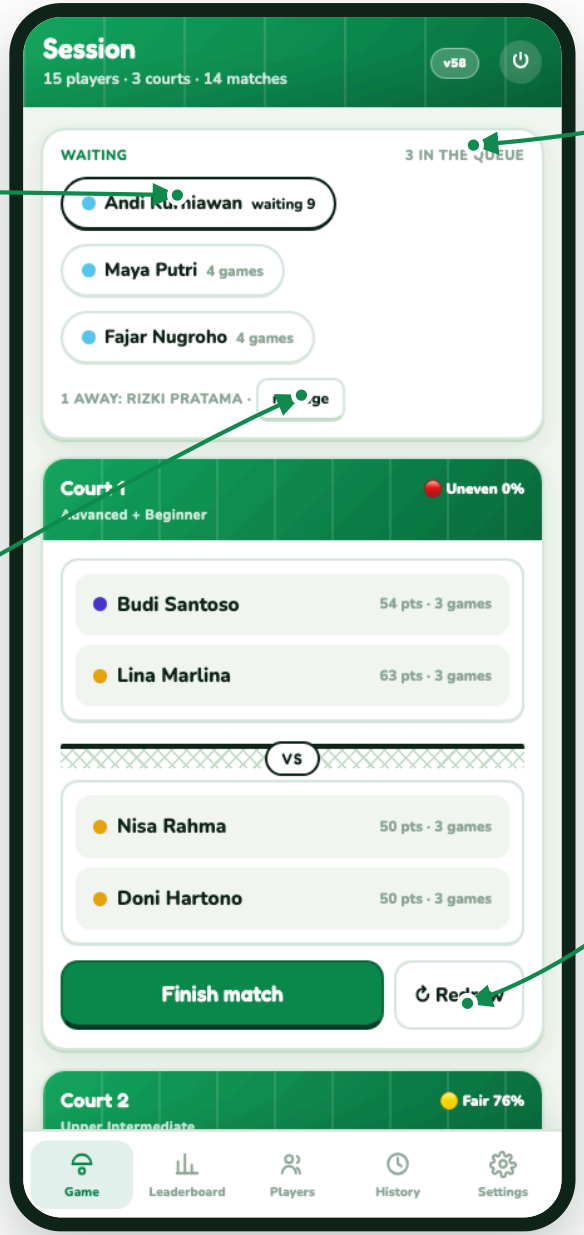

GAME · NEW

Somebody being left behind

A pill normally shows games played. After five matches without a game it turns amber and reads **waiting 9** instead. That is the one person to put on next.

Who is sitting out

Away players are listed here and are never drawn into a court. Tap **manage** to bring somebody back.

How deep the queue is

Fewer than four waiting and a finished court cannot be refilled at all. As a rule of thumb you want at least **four players per court, plus five** — so 13 on two courts, 17 on three.

Redraw this court

Draws four different players for this court only, leaving every other court alone. Use it when the balance looks wrong before anyone has started playing.

The queue is ordered by games played, fewest first. It is **not** a prediction of who goes on next — when the app draws a court it weighs skill and variety as well as waiting time.

Away, and back again

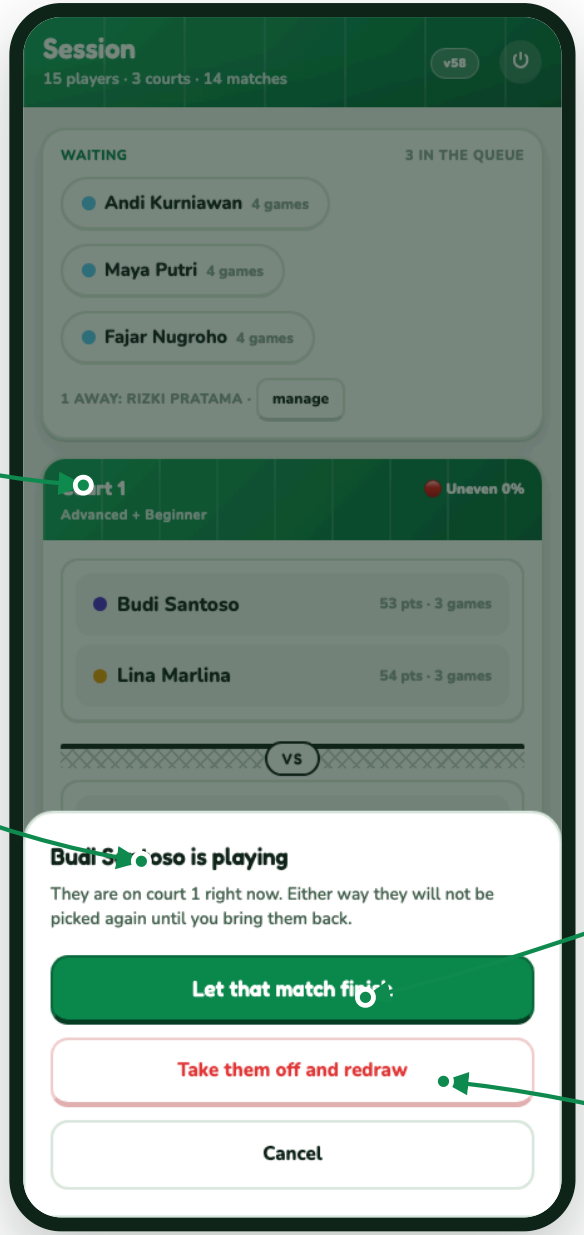

PLAYERS · NEW

It names the court

So you can look up and check which match you are about to interrupt before you decide.

It asks before it acts

Marking somebody away while they are standing on a court used to do nothing visible. Now the app tells you where they are and makes you choose.

Let that match finish

They play this one out and are never picked again afterwards. This is the usual answer — nobody's game gets spoiled.

Take them off and redraw

The court is drawn again from scratch without them, and the match in progress is abandoned. For somebody who has actually left the hall.

Away is for somebody stepping out, not leaving for good. When they return tap **Back** — they rejoin level with whoever has played least, so they neither jump the queue nor start from the bottom. Their points and games are untouched the whole time.

Who is actually winning

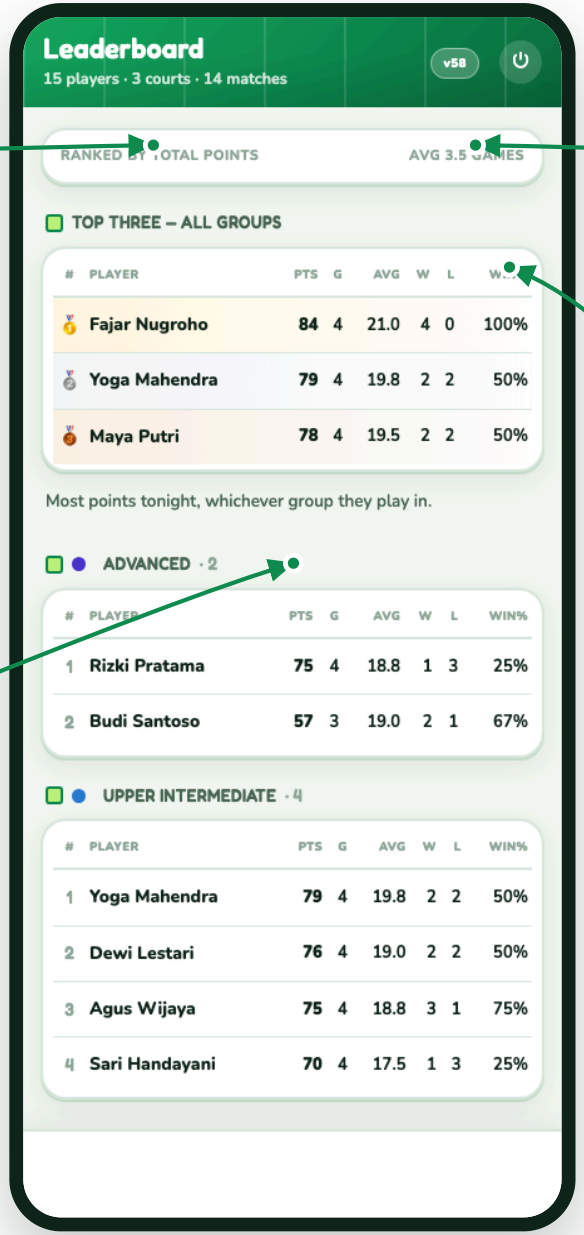

LEADERBOARD

You choose the measure

Total points, average per game, or win percentage. Change it in Settings — it only changes the ranking, never the results.

These groups need Same level

Per-group tables only mean something if courts were drawn within a group. In Social mix everyone is jumbled together.

How much to trust it

The average number of games played. Below three or four, the table is mostly luck.

Top of the board ≠ best player

A beginner who keeps winning close games can out-rank an advanced player. That is the point of grouping by level.

A flat leaderboard is the app working, not failing. Good matchmaking makes everyone finish close together.

Fix mistakes now, not later

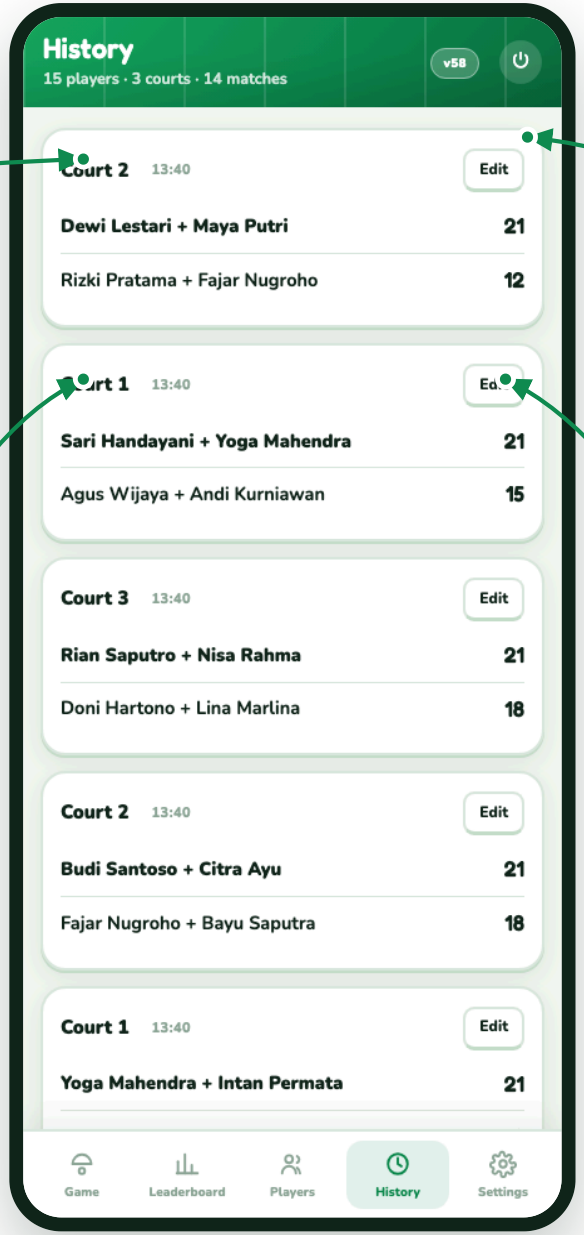

HISTORY

The winner is the bold one

Both teams are listed; the winning pair is the one in heavy type with the higher score.

Undoing puts points back

The four players get their points and their game back, and return to the queue in the right place.

Edit any match

Edit changes a score you typed wrong. The leaderboard updates the moment you save it.

Undo removes the newest

Undo last match only ever removes the most recent one. To remove an older match, undo your way back to it.

Every finished match is listed newest first, with the court and the time it ended.
